DESCRIPTION

DRF7020D13 is a low-cost sub-1 GHz transceiver module designed for operations in the unlicensed ISM (Industrial Scientific Medical) and LPRD bands. GFSK (Frequency Shift Keying) modulation/demodulation, multi-channel operation, high bandwidth efficiency and anti-blocking performance make DRF7020D13 modules easy to realize the robust and reliable wireless link.

The module can be configured to work in different channels with 200k Hz space. It adopts high efficient looped interleaving EDAC (Error Detection and correction) coding with coding gain up to 3dB which keeps in advance in EDAC and coding efficiency over normal FEC (Forward Error Correction). Because of its high reliability in correction, modules can filter error and fake information automatically and realize truly transparent wireless link, which makes DRF7020D13 very suitable in the rigid communication environment.

DRF7020D13 integrates 256 bytes buffer. When the buffer is empty, users can transfer 256 bytes data per time and even limitless data transfer can be achieved as long as RF data rate (RF module to RF module) is configured to be faster than UART data rate (MCU to RF module). The module provides standard UART/TTL interface for selection. Users can choose seven data rates and three parity checks which make DRF7020D13 possibly tailor-made for different applications.

DRF7020D13 operates at 3.3~5.5V with extra low standby current which makes it suitable for battery powered-up applications.

2. Parameter Setting

Users can configure the parameters (frequency, data rate, output power, etc.) of RF modules by PC or MCU.

- ◆ **BY PC.** The interface of DRF7020D13 is UART/TTL. If connecting it to PC, users need to use a TTL-to-RS232 level converter to transform the different levels. Dorji Applied Technologies also provides converter board for configuration.

Firstly users need to insert module into converter board and connect converter board to PC by cable, then open DORJI RF software. After that the status column of tool should display “Found Device”. Users then can read/write the module. For more details, please check the operation manuals of converter boards on accessory page.

- ◆ **BY MCU.** The module can work normally 50ms (T1) after powering on. When configuring the module, users need to switch the SET pin to low and the module then enters into setting mode after 1ms or more (T2). It will use 9600 bps (data rate) and no parity check as default format to communicate.

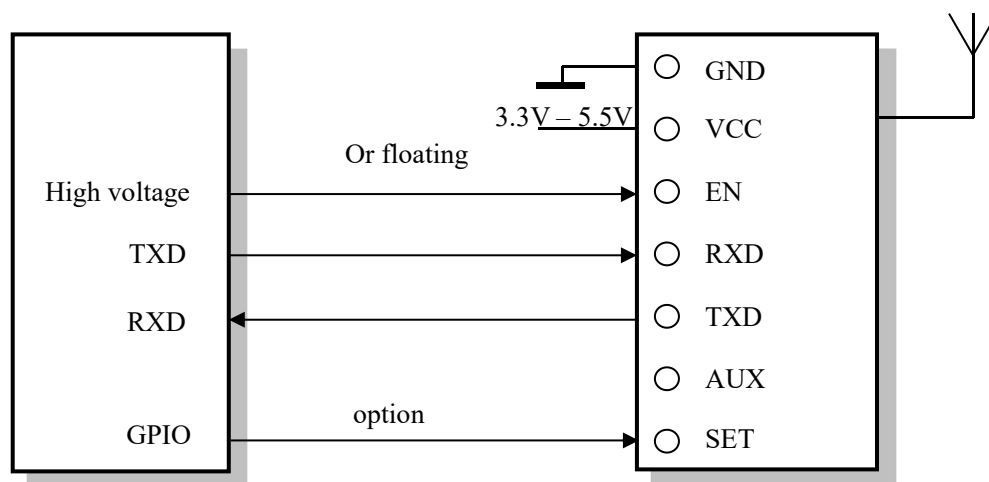

Figure 2: Connecting Diagram

When a command is sent to the module through the RXD pin, the module will send back response information by TXD pin in 200ms after it verifies the command is correct. When users check out the parameters are successfully set from the response information, the SET pin can be set to high and the module will work with the new settings in 10ms (T4).

Please note that users only can send command once when the SET pin is configured to low. If users want to revise the parameters after a successful setting, users must configure SET pin to high and then set it into low in order to reconfigure the module. After 10ms (T4), the module will work with the new parameters.

The commands of DRF7020D13 are in ASCII format. The default configuring data rate is 9600 bps and no parity check is adopted. The command set include two commands: Read command and Write command.

- ◆ **Read command: RD ✓**
Response (from module): PARA_Freq_DRFSK_POUT_DRIN_Parity ✓
- ◆ **Write command: WR_Freq_DRFSK_POUT_DRIN_Parity ✓**
Response (from module): PARA_Freq_DRFSK_POUT_DRIN_Parity ✓
